## ngspice-46 vs. a commercial simulator (Spectre) — feature gap analysis

A capability comparison of the ngspice-46 build in this repository against a Spectre-class commercial simulator, to show where the open-source tool already matches the commercial one and where the gaps are. Grounded in a direct read of the ngspice-46/src/ tree (analyses, solver, devices, RF, convergence, parallelism), not marketing feature lists.

Legend: ✓ present / on par · ⚠ partial, experimental, or via a workaround · ✗ absent. "Spectre" stands in for the commercial reference (Spectre / SpectreRF / Spectre X / RelXpert feature set).

The one column that matters is ngspice — Spectre has essentially everything, so its column is a baseline of ✓. The point of the table is where ngspice's mark is ⚠ or ✗.

Context: the Verilog-A / OSDI device side is not a gap — thanks to the OpenVAF-reloaded compiler in this repository it is on par with (often ahead of) commercial Verilog-A support. The gaps below are all on the simulator/analysis side.

## Core numerics

| Category    | Feature                                         | ngspice        | Spectre |
|-------------|-------------------------------------------------|----------------|---------|
| Core solver | Sparse LU (KLU) direct solver                   | ✓ <sup>1</sup> | ✓       |
| Core solver | Legacy Sparse1.3 fallback                       | ✓              | ✓       |
| Core solver | Parallel / partitioned / GPU linear solve       | ✗              | ✓       |
| Core solver | Matrix reordering + scaling beyond KLU defaults | ⚠              | ✓       |
| Integration | Trapezoidal + variable-order Gear               | ✓              | ✓       |
| Integration | Advanced LTE-based step/order control           | ⚠              | ✓       |
| Convergence | gmin stepping + source stepping homotopy        | ✓              | ✓       |
| Convergence | Pseudo-transient / dynamic-gmin continuation    | ⚠              | ✓       |
| Convergence | Damped / trust-region (globalized) Newton       | ⚠              | ✓       |
| Convergence | Coordinated accuracy presets (errpreset)        | ✓              | ✓       |

The two convergence ⚠ rows: ngspice's DC path is not naked — it has per-device junction limiting (30 device families), an optional `nodedamping` step clamp, and a multi-stage homotopy cascade (`dynamic_gmin` → `new_gmin` → `spice3_gmin` → source stepping). What it lacks vs. commercial tools is a principled globalized Newton (residual-based trust-region / Armijo) and a classic pseudo-transient ( $\dot{X}$ -embedded) continuation. [Enhancement-111](#) adds the former: `.option linesearch`, an Armijo backtracking line search on a new KCL-residual merit  $\|F\|=\|G\cdot x-b\|$  (result-neutral, off by default) — see the [implementation write-up](#). [Enhancement-112](#) then extended it to the KLU solver — it originally ran only under Sparse 1.3 and segfaulted under `.option klu` — so the line search now works under both linear solvers, with a residual-merit sequence numerically identical between them.

<sup>1</sup> KLU is compiled in (SuiteSparse, statically linked) but is not the default in this build — the default direct solver is Sparse 1.3; KLU is selected with `.option klu`. The two agree on DC / AC / transient, and — since [Enhancement-113](#) — on noise and single-ended pole-zero as well (the KLU adjoint solve was doing a non-transposed solve, silently wrong

on asymmetric matrices; now fixed), and — since [Enhancement-114](#) — on DC/AC sensitivity (`.sens`), and — since [Enhancement-115](#) — on distortion (`.disto`) too. The only analysis still Sparse-only under KLU is balanced-output pole-zero; KLU is also less robust on stiff transient edges. Full behavior, defaults, and a solver-by-solver sweep of the example suite: [KLU vs. Sparse 1.3 solver notes](#).

## Standard analyses (analog)

| Category | Feature                                                                              | ngspice | Spectre |
|----------|--------------------------------------------------------------------------------------|---------|---------|
| Analyses | DC operating point / DC sweep                                                        | ✓       | ✓       |
| Analyses | Transient ( <code>.tran</code> )                                                     | ✓       | ✓       |
| Analyses | AC small-signal ( <code>.ac</code> )                                                 | ✓       | ✓       |
| Analyses | Noise, small-signal ( <code>.noise</code> , <code>onoise/inoise</code> + integrated) | ✓       | ✓       |
| Analyses | Pole-zero ( <code>.pz</code> )                                                       | ✓       | ✓       |
| Analyses | Transfer function ( <code>.tf</code> )                                               | ✓       | ✓       |
| Analyses | DC sensitivity ( <code>.sens</code> )                                                | ✓       | ✓       |
| Analyses | Distortion ( <code>.disto</code> )                                                   | ✓       | ✓       |
| Analyses | Measurement / post-processing ( <code>.meas</code> )                                 | ✓       | ✓       |

## RF / periodic steady-state suite

| Category | Feature                                                  | ngspice        | Spectre |
|----------|----------------------------------------------------------|----------------|---------|
| RF       | S-parameter analysis + noise figure ( <code>.sp</code> ) | ✓              | ✓       |
| RF       | Touchstone ( <code>.snp</code> ) import / export         | ✓              | ✓       |
| RF       | Periodic steady state (PSS)                              | ✓ <sup>1</sup> | ✓       |
| RF       | Harmonic Balance (HB)                                    | ×              | ✓       |
| RF       | Periodic / phase noise (Pnoise)                          | ×              | ✓       |
| RF       | Periodic AC (PAC, conversion gain)                       | ×              | ✓       |
| RF       | Periodic transfer function (PXF)                         | ×              | ✓       |
| RF       | Periodic S-parameters (PSP)                              | ×              | ✓       |
| RF       | Quasi-periodic / multi-tone (QPSS / QPAC)                | ×              | ✓       |
| RF       | Envelope following                                       | ×              | ✓       |

<sup>1</sup> PSS was ⚠(experimental `--enable-pss` flag, so `.pss` was unimplemented in shipped builds, and ~230 lines of shooting-loop trace per run). Since [Enhancement-117](#) it is built by default, quiet (trace behind `set ngdebug`), and verified against the analytic AC response; [Enhancement-118](#) then made it run under both linear solvers (KLU had hung on a timestep explosion from reused refactor pivots — now a full re-factor is forced each PSS step under KLU). It is still a brute-force shooting method and remains the foundation for the periodic small-signal analyses below. HB exists only as a `WITH_HB` stub that returns “unsupported”.

## Performance & scale

| Category    | Feature                                                             | ngspice | Spectre |
|-------------|---------------------------------------------------------------------|---------|---------|
| Performance | Multithreaded device-model evaluation (OpenMP)                      | ✓       | ✓       |
| Performance | Element bypass / latency exploitation                               | ⚠       | ✓       |
| Performance | Fast-SPICE hierarchical / isomorphic engine                         | ×       | ✓       |
| Performance | Distributed (MPI) / cloud partitioning                              | ×       | ✓       |
| Performance | Handles 10 <sup>6</sup> –10 <sup>8</sup> -node post-layout netlists | ×       | ✓       |

## Statistical / variability / yield

| Category    | Feature                                         | ngspice | Spectre |
|-------------|-------------------------------------------------|---------|---------|
| Statistical | Monte Carlo                                     | ⚠       | ✓       |
| Statistical | Native process/mismatch modeling + correlations | ⚠       | ✓       |

| Category    | Feature                                                       | ngspice | Spectre |
|-------------|---------------------------------------------------------------|---------|---------|
| Statistical | Low-discrepancy sampling (Sobol / Latin-hypercube)            | ×       | ✓       |
| Statistical | High-sigma methods (importance sampling, worst-case distance) | ×       | ✓       |
| Statistical | Corner + MC + yield estimation flow                           | ⚠       | ✓       |

Monte Carlo is ⚠ works, but script-driven (`alter + sgauss`, with the deterministic-seed RNG from Enhancement-10/66) rather than a native statistical block with sampling controls.

## Reliability / aging

| Category    | Feature                                          | ngspice | Spectre |
|-------------|--------------------------------------------------|---------|---------|
| Reliability | Device aging (HCI / NBTI / TDDB)                 | ×       | ✓       |
| Reliability | Stress → degrade → re-simulate (fresh/aged) flow | ×       | ✓       |
| Reliability | Electromigration + IR-drop (EMIR)                | ×       | ✓       |

## Post-layout / parasitics

| Category    | Feature                                | ngspice | Spectre |
|-------------|----------------------------------------|---------|---------|
| Post-layout | Flat parasitic (RC) netlist simulation | ✓       | ✓       |
| Post-layout | RC reduction / model-order reduction   | ×       | ✓       |
| Post-layout | n-port (S/Y/Z) extracted-block import  | ✓       | ✓       |

## Behavioral / mixed-signal / AMS

| Category | Feature                                    | ngspice | Spectre |
|----------|--------------------------------------------|---------|---------|
| Modeling | Verilog-A (analog, LRM Annex C) via OSDI   | ✓       | ✓       |
| Modeling | XSPICE code models + event-driven digital  | ✓       | ✓       |
| Modeling | Verilog-AMS mixed-signal (connect modules) | ×       | ✓       |
| Modeling | Real-number modeling (wreal / RNM)         | ×       | ✓       |
| Modeling | VHDL-AMS                                   | ×       | ✓       |

## Interfaces & infrastructure

| Category       | Feature                           | ngspice | Spectre |
|----------------|-----------------------------------|---------|---------|
| Interface      | Shared-library / programmatic API | ✓       | ✓       |
| Interface      | Python bindings                   | ✓       | ✓       |
| Infrastructure | Built-in optimizer                | ×       | ✓       |
| Infrastructure | Checkpoint / restart of long runs | ⚠       | ✓       |

## Where to invest (given the Verilog-A/OSDI side is done)

The realistic, winnable identity for this project is the open-source, OSDI/Verilog-A-native simulator with a real RF-noise and statistical story — not out-engineering 25 years of commercial fast-SPICE/parallel work. Ranked by leverage on the existing strength × differentiation × tractability:

1. RF periodic small-signal suite — PAC → Pnoise → PXF, on the hardened PSS. The PSS foundation is now shipped and verified under both linear solvers (Enhancement-117, Enhancement-118), and Enhancement-119 retains the periodic operating point (voltages + device states per sample) and Enhancement-120 turns it into the periodic Jacobian harmonics  $G_k$ ,  $C_k$  — the substrate and the blocks these analyses are built from. The device/OSDI side already supplies the rest (noise-source topology, operating-point- and frequency-dependent `load_noise`); the remaining work is the conversion-matrix solve + `.pac` command (E-121). Genuinely novel in open source.

2. Convergence robustness — coordinated accuracy presets (`errpreset`) landed in [Enhancement-110](#); the remaining piece is pseudo-transient / dynamic-gmin homotopy. Unglamorous but makes every analysis usable on real circuits; self-contained in the ngspice core.
3. High-sigma statistical sampling — high industrial value (yield / SRAM), moderate difficulty, leans on the deterministic-seed RNG already in place.

Explicitly lower priority: fast-SPICE parallelism and aging/EMIR — enormous efforts that don't leverage what makes this project distinctive.
